Marine related research and the future European Maritime Policy: A background document prepared by the services responsible for the management of relevant projects under the EC RTD Sixth Framework Programme (DG RTD, DG TREN, DG FISH, DG ENTR)

1. INTRODUCTION

Marine research has been identified by the Commission as a key element of the future Maritime Policy. This is recognised both in the recent Communication on Maritime Policy and in the EU overall strategic objectives for 2005-2009, where it is noted that an all-encompassing maritime policy should be supported by excellence in marine scientific research, technology and innovation.

This paper outlines the challenges and opportunities in marine related research in Europe with respect to a future EU Maritime Policy. The paper describes the contribution from the European Research Framework Programmes as well as from other research activities at international level, and their impact on the marine and maritime sector.

The European Research Framework Programmes contribution and impact on the marine and maritime sector

Specific challenges arising in the domain are considered, as well as the opportunities offered by the existing schemes; consideration is given also to new activities that could or should be undertaken in support of a future Maritime Policy.

Research is a cornerstone that supports competitiveness and sustainable development in line with the three pillars of the Lisbon Agenda (Economic, Social, and Environmental). Quality research that engages with societal stakeholders and communicates in ways that are perceived as being trustworthy and relevant is a pre-condition for a knowledge driven economy and a major contribution to developing robust and sustainable solutions to complex problems. Moreover European Research is contributing to the development of educational horizons, new skills and to the creation of high value-added knowledge-based jobs.

Research is a cornerstone that supports competitiveness and sustainable development in line with the Lisbon Agenda

All these aspects are considered as paramount for the development and implementation of the European Maritime Policy. It is also an opportunity to demonstrate the benefits for EU citizens arising from European research, as well as further enhancing the articulation of the European Research Area.

1.1. EU Research and Maritime Policies – mutual benefits

European Research can contribute directly to the objectives of Maritime Policy by means of its horizontal knowledge-intensive dimension cutting across the different policy facets.

At the same time European Research will benefit from a Maritime

Policy which will improve the visibility of science, technology and development activities and their impact on the society. Moreover it contributes to a larger dissemination of information and to a better acknowledgement of the benefits arising from the different research initiatives at European and international levels.

The new holistic approach of the Maritime Policy will contribute to integrating the different policies still considered in isolation and to overcoming the present fragmentation and lack of cohesion of marine related research funded at the national level.

2. MARINE RELATED RESEARCH – CHALLENGES AND OPPORTUNITIES

2.1. 2.1 Main challenge: Using responsibly the full potential of the oceans

Oceans offer a huge potential of under-exploited resources

Oceans represent the last under-explored domain on Earth. They inspire our curiosity and awe with their sheer size and power, but also their beauty and fragility. They cover two thirds of our planet and yet in many cases are represented as almost blank areas on our maps. They offer the huge potential of under-exploited resources, economic activities and well-being of the citizens.

Yet, some of the oceans' ecosystems have been degraded significantly over the last hundred years or so, particularly through unsustainable and destructive forms of exploitation and the serious pollution of coastal waters. Oceans are also a fundamental component of the European and global climate systems. The Gulf Stream is considered the driver of Europe's moderate climate. Changes in ocean currents and other dynamics are an indicator of global climate change. Thus, oceans need to be investigated, but also to be used responsibly.

The marine environment represents a potentially vast reserve of under-explored natural resources

The maritime economy is much more significant and strategic than it is generally perceived. It includes diverse – and sometimes conflicting – exploitation of the marine resources and economic use of the sea.

Moreover, today perhaps only about 5% of the marine biodiversity is known, though global public documentation and archiving initiatives are underway to study what is there. The marine environment therefore represents a potentially vast reserve of yet under-explored natural resources. Studying what is there, understanding its nature and dynamics and developing adequate technologies is a condition for this economy to develop in sustainable ways.

European shipbuilding industry is the world market leader

In the maritime field, the manufacturing industries supply the largest amount of resources to research, development and innovation. European shipyards are the world market leaders in terms of turnover and innovative products and processes, investing 10% of their yearly turnover in research and innovation. It is a high technology industry. In most maritime fields of activity, improved functions are driven by

innovative ships and other floating structures.

A competitive European shipbuilding industry is a crucial factor towards improved maritime performance, and therefore leads to exploiting growth opportunities in several related maritime fields.

It is particularly the case for the transport industry: maritime transport grows at a very high rate; around 80-90% of global trade and of European import/export is transported by sea; more than 40% of EU internal trade is waterborne. High quality capacity waterborne transport is less costly and more environmental friendly than road transport and a shift between the two modes could lead to millions of euro savings. The development of innovative efficient, safe and environmentally sustainable ships, as well as appropriate consideration to hinterland connections in expanding port capacity is paramount to meet this target.

A competitive maritime transport is crucial for an improved maritime performance

The EU is one of the major world fishing powers and a major market of processed and aquaculture products imported from third countries. In 1998, the value of the whole production chain (fishing, aquaculture, processing and marketing) reached approximately 20 billions € (0.28% of EU GDP).

Aquaculture has been one of the fastest growing areas in the food sector. The value of the member states' production is currently about € 3 000 million per year. Aquaculture constitutes about 17% of the volume and 33% of the value of the total EU fishery production. EU-15 total employment in the fishery and aquaculture sector, according to the most recent figures available, is over 500 000 persons employed. Marine fishing accounts for the largest share of direct employment in the sector (241 010 jobs), followed by Fish-processing (89 468 individuals) and aquaculture (61,898 jobs, over 80% of which in marine aquaculture). These activities play a significant role especially in regions where alternative job opportunities are scarce.

The importance of fishery and aquaculture in European economy and employment

Marine biotechnology in Europe has huge potential for innovative, sustainable research with a view to provide solutions to societal needs. The global market has been valued at \$2.4 billion with a predicted growth rate exceeding 10% per annum, making marine biotechnology one of the most exciting emerging technology sectors. Marine biotechnology will contribute to nearly every industry sector, from healthcare to bioremediation and from cosmetics to nutraceuticals. Furthermore, marine metagenomics provides a novel approach to the exploitation and understanding of as yet poorly understood marine biodiversity, and nutraceuticals, i.e. nutritional supplements, is a major growth area for both the pharma and food and feed sectors.

Marine biotechnology: an emerging sector with huge potential to provide solutions to societal needs

The intrinsic intangible environmental, economic, social value of the oceans The oceans and marine environment also provide a range of intangible goods and features which cannot be easily quantified in commercial terms but nonetheless have an intrinsic environmental, economic and social value. There is a need to expand basic understanding of ocean ecosystems and the mutual influence of the marine ecosystems and human activities.

Integrated ecosystem-based approaches across scientific disciplines and sectoral types of expertise, involving engagement with the full range of stakeholders, can unlock this high potential, the sustainable exploitation of which is the main challenge of the proposed innovative approach.

2.2. Specific challenges

Europe is facing specific challenges for which innovative cutting-edge research and new technologies - guided through multi-stakeholder dialogue - are crucial:

Competitiveness: Sustainable economy and wealth generation

Research provides the scientific knowledge base that supports the safe and sustainable development of marine resources, services and industries in a more integrated way for the benefit of EU citizens. It promotes employment and maintains Europe's knowledge-based competitive advantage within the maritime sector thus contributing towards the achievement of the Lisbon Agenda.

Consolidated sectors and new economic opportunities Consolidated economic sectors in which advanced research can significantly contribute to sustainable development and economic growth are, among others, restoring degraded marine ecosystems and developing sustainable forms of marine aquaculture, fishery, shipbuilding and maritime transport, port management, energy, tourism.

New economic opportunities can be offered by biotechnology research for new pharmaceuticals and food-related compounds; by the exploitation of renewable energy sources (tidal and wave power, off-shore wind farms); by the further development of environmentally compatible technologies for the utilization of natural resources (seabed minerals; water desalination).

Publicly funded or co-funded research supports the sustainable management, production and use of natural resources, to provide new competitive products whilst decreasing environmental impact and maximising social added value.

A continued engagement with the full spectrum of stakeholders is Research agenda and priorities have been set up by way of consultation with industry stakeholder groups (i.a. the Waterborne Technology Platform and the Maritime Industry Forum) and in collaboration with Commission services in charge of sectoral policy

making in order to ensure that research is correctly targeted.

*necessary to
achieve*

Mutually the related competitiveness policy areas can in this way benefit to the maximum extent from European research activities.

*scientifically
sound and widely
acceptable*

Robust and widely acceptable solutions supported by scientifically validated knowledge require continued engagement with the full spectrum of stakeholders from government, civil society organisations and movements and private sector.

solutions

Environment and societal goals including biodiversity: Climate change, pollution, natural and man-made phenomena and hazards

Research provides the necessary scientific underpinning to the formulation and implementation of workable policies and strategies for marine governance at local, regional and global levels and contributes to the dissemination of appropriate best practices and technological solutions. To be most effective, this relies on an ecosystem-based approach which fully engages all relevant stakeholders.

*An ecosystem-
based approach*

Specific areas in which the contribution of research is needed include: developing the ecosystem-based management approach, including marine spatial planning; the development of technical and managerial/institutional solutions for coastal zone protection and management; sustainable management of resources and restoration of degraded marine ecosystems; environmental monitoring technologies – GOOS (Global Ocean Observing System), GMES (Global Monitoring for Environmental Security); assessment tools; safe maritime transport, ship disposal and secure maritime structures.

Furthermore research helps in fighting the pollution of seas (oil, SO₂, NO_x, acidification) and of eco-systems, including species transfer, mitigation or preparedness for natural disasters (tsunami, typhoon, flooding) and understanding the global climate change. Land-shore interfaces (especially discharges to sea) are also a main concern of research activities, as well as marine safety and security (cf. the new international port security rules), piracy (a real, current problem in some parts of the world traversed by European shipping), terrorist threats.

*Research helps in
fighting pollution
and in setting
international
standards*

The development and implementation of international standards is also based on the results of advanced research projects, in particular when these are considered within a global framework such as the Group on Earth Observations (GEO) initiative to develop the Global Earth Observation System of Systems (GEOSS).

The fisheries and aquaculture European research community needs to grow further to be capable of addressing the new challenges facing Europe, where the move towards an ecosystem based management of

natural resources will require answers to very complex questions.

Supporting Capacities and Decision Making: Human resources, dissemination, awareness and education, knowledge transfer, need and effective use of European research infrastructure

A well communicated research provides the creation of new opportunities Research results provide the necessary science-knowledge base and communication strategy to inform citizens and society at large on marine resource development, restoration, conservation and sustainable use, contributing to the quality of life. Ensuring that knowledge generated by research directly and visibly contributes to socio-economic development and innovation, that Europe has the necessary research infrastructure to effectively tackle Europe's research and societal challenges, these are certain of the answers to the lines set up by the Barcelona European Council in March 2002, aiming at a competitive economy based on knowledge combined with responsible international cooperation.

The development of future policies demands an early scientific input in the process. Well-communicated research provides the knowledge enabling the formulation of realistic and enforceable regulations and creation of new opportunities. The dimension and mechanisms where research can provide support should be specifically considered within each policy area.

The development and successful implementation of the ongoing Common Fisheries Policy reform, for example, is highly dependent on research and scientifically based advice. The Scientific Support to Policy theme in the EC 6th Research Framework Programme has been a successful tool; considerable benefits are expected from this activity, proven to be a cost effective mechanism, capable to effectively bring new concepts and management tools into policy actions. (cf. Showcase – Research in Support to Policy).

2.3. Opportunities offered by European Research to the Maritime Policy

The European Research Area addresses the fragmentation of European research and aims at avoiding duplication of efforts Research activities in Europe and with partners in other parts of the world are undertaken by the EC Research Framework Programmes (FPs), as well as by national research programmes and private initiatives. However, European research is still fragmented, with duplicate efforts and often poor communication between programmes. Consequently the efforts to build a European Research Area (ERA) are a major change in approach to address these weaknesses. ERA aims at integrating research efforts, better structuring research capacity and coordinating European research activities, while at the same time working towards increasing the impact potential of research through

links with education and innovation and by placing an emphasis on multi-stakeholder engagement and effective communication.

The EC research FPs are a major driving force in building the ERA.

Structuring, strengthening and coordinating effects and the consequent increased impact can be achieved through:

Connectivity: Between sectors and policy domains

The cross-cutting nature of research is reflected in the Maritime Policy: the extent and mechanisms where research can provide support are specifically considered within each policy area. The development of the future policies requires an early scientific input to the process, as research provides the necessary knowledge to enable the formulation of realistic and enforceable regulations and the creation of opportunities.

Research is cross-cutting the various aspects of the maritime policy

In the logic of the innovative comprehensive approach, the sectoral separation of research activities can be overcome by a trans- and interdisciplinary cross-fertilization – including socio-economic research – to be developed in the framework of a marine research agenda. Moreover, engagement with the full range of stakeholders is to be encouraged to facilitate uptake of results and increase its impact.

A marine research agenda can overcome the sectoral separation by a trans- and interdisciplinary cross-fertilization

Research in support to Community Policies (Specific Support to Policies activity in FP6), Technology Platforms within an industrial context, and ERA-NET activities (Networking of national or regional research programmes) within a science driven context are important examples of how “connectivity” is being improved at European, regional and national levels. These instruments can be fully exploited within a European Maritime Policy.

By its very nature, marine research has many international aspects and will have to be further internationalised in line with globalisation trends. This implies a need to both attract talent and experience from other parts of the world to work with European teams in pursuit of knowledge and viable solutions in Europe as well as bringing European expertise to bear on problem solving in the socio-economic context of international cooperation partner countries.

All FP instruments can be fully exploited within a European Maritime Policy

Complementarity: Exploiting the synergies and complementarities at international, European, national and regional level.

Commonalities are recognised between different EU policy areas which may previously have operated in isolation: Regional Aid supports, under the Interreg II programme, research activities in coastal regions; research projects that relate to clean disposal of ships managed by the Directorate General for Research are of a direct interest to the Directorate General for Environment.

The Maritime Policy provides a focus for coordinating different initiatives and can be a catalyst for further actions

Ocean monitoring systems arising from advanced communication technologies can provide data for both the environmental programmes and for monitoring the movements of ships for security and regulatory purposes, not only in Europe but in other parts of the world as well. The multi-annual programme for fisheries data collection may also be beneficial to others users (DG ENV, RTD). Eureka, COST and national programmes can provide a complement at a European level. Specific international cooperation actions are an integral part of FPs and will facilitate addressing some of the international dimensions of any marine policy

The development of a ERA that is open to the world reduces these overlaps and ensures complementarities as a longstanding goal for European Research. The Maritime Policy provides a focus for these coordination activities and can be a catalyst for further actions.

The regions are becoming increasingly more important in Europe, as are globalisation processes and interconnectedness between different regions and countries in the world; this is well reflected also in research.

The Regions of Knowledge support the development of research-driven regional clusters Building on the successful pilot scheme initiated under FP6, the Regions of Knowledge action in FP7 aims at strengthening the research potential of European regions, in particular by encouraging and supporting the development of research-driven regional clusters, associating regional authorities, universities, research centres, and enterprises. Such clusters would cover joint analysis of regional research agendas; mentoring of regions with a less developed research profile by highly developed ones based on R&D focussed cluster building; initiatives to improve integration of research actors and institutions in regional economies, through their interactions at cluster level.

The role of European Structural Funds In this context the role of European Structural Funds will have an increased importance, focussing on knowledge, research and innovation in the future so as to fully implement growth and employment as indicated in the Lisbon strategy. It is possible to envisage that a number of activities related to research and innovation, such as regional clusters, poles of excellence, technology transfer, business support services and human capital development can be financed from the Structural Funds, with a major gearing effect on more specific scientific research activities.

International cooperation in research, but also in other relevant policy areas from foreign relations, development, trade and environment, is particularly pertinent on marine issues, which are by their nature international to a very large degree.

Curiosity: Exploring the new frontiers of knowledge.

The oceans, like space, have a role to stimulate human beings' fundamental desire to explore and understand their environment. The largest area of our planet is covered by oceans and is still largely unexplored. There is a large potential for curiosity-driven research to advance knowledge and understand seas and maritime phenomena which often have a huge social or economic impact (cf. for example the effects of 'El Niño', sea ice, etc). This innate curiosity provides underlying fundamental knowledge which is of unknown future benefit, but can not be ignored.

Fundamental knowledge of unknown future benefit can not be ignored

Such curiosity driven explorations have been the basis for creating new knowledge and advancing the existing understanding, thereby also leading to many innovations. A wide range of basic maritime research opportunities are available in Europe and the involvement and engagement of European scientists is crucial. The proposed FP7 foresees in particular support for basic, knowledge driven research of this type. The body that will support basic, curiosity-driven research under FP7 will be the European Research Council.

The European Research Council will support basic, curiosity-driven research

3. COMMUNITY'S SUPPORT TO MARINE RELATED RESEARCH

3.1. Introduction

European marine research is well-developed, in terms of both human resources and infrastructures. The EU Research Framework Programmes and other initiatives have strengthened European cooperation in this field.

In financial terms, however, the European Community Framework Programmes for research, technological development and demonstration account for a modest percentage of the total public effort. This means that most of the marine related research is going on through a variety of programmes and activities.

The added value of R&D action at EU level:

- overcoming the fragmentation of the R&D investment
- Community research is a vehicle that streamlines R&D investments, adding value through coordination and the transfer of knowledge across frontiers.
- EU R&D fosters excellence through training, mobility, career development and competition at European level.

EU research funding has a significant economic impact: each Euro invested in Framework Programme leads to a mid- to long-term economic return of 4 to 7 €.

Participants at EU level are willing to invest additional resources of

their own to have access to foreign researchers and output in a way that national funds cannot provide;

EU projects have large economic multipliers associated with them, as the pooling of competencies and resources increases the likelihood of a breakthrough in a given area.

3.2. European Research Framework Programmes

The European Community Framework Programmes and the evolution of their S&T approaches

European Community Research, Technological Development Framework Programmes concentrate RTD efforts towards specific at a European and international level within a limited number of priorities.

Within each priority detailed research topics and themes are identified. The FP also supports research for the formulation and implementation of Community Policies, by providing scientific contributions that are targeted on precise needs and that are coherent across various policy areas.

There has been an evolution of the underlying approaches of technology driven approach (FP4: 1994-1998), through problem (2002) to the establishment of the European Research Area (2006).

Examples of the different approaches in the marine related sector are given below.

Storing and disseminating basic knowledge

In the aquatic/marine areas there are some noteworthy initiatives of organising and archiving basic knowledge on marine life in publicly assessable forms supported by research and cooperation activities of the European Commission. One example is the web-based archive of scientifically validated information, [FishBase](http://www.fishbase.org), which serves more than 2 million users each month (>20 million hits) and has more than 1000 voluntary collaborators from all over the world. (www.fishbase.org)

An ecosystem-based approach to fisheries management

Initiatives for promoting the progressive adoption of an ecosystem-based approach to fisheries management, notably through the use of area-based fishery management tools, are also of relevance. Specific and complementary research projects funded under FP6 investigate the potential of different regimes in protected areas as a measure to preserve sensitive and endangered species, habitats and ecosystems from the effects of fishing. (Box 4).

Work on species transfers through ballast water have also involved Europeans in leading positions and involved dynamic international collaborations.

However, as previously mentioned, European research is still often fragmented with research efforts being partially duplicated at the national level.

Consequently building the ERA is a major initiative to address these weaknesses. It aims at integrating and coordinating European research efforts, better structure research capacity and engages with a range of stakeholders both within Europe and internationally.

Europe could enjoy better socio-economic benefits when the Framework Programme is complemented with substantially increased Member State investment in research and stronger connection between research and society. A recent model calculation shows that doubling the EU research budget would cause Europe's GDP in 2030 to be 1,6% larger than under a business as usual scenario. This figure would be as large as 4,8% if Member States would double their growth rates of research investment during the duration of FP7 (2006-2013).

R&D investments are a clear driver for growth and innovation, but a study of the European Environment Agency in 2001 (Late lessons from early warnings) showed that it can take between 30 and 150 years to achieve uptake of research results, unless there is stakeholder engagement and specific attention paid to communication beyond the scientific community. Therefore, financing European research cooperation together with the structuring influence of the EU research programme on national funding schemes adds value.

Maritime Research in FPs 4-6

Due to the complexity of the challenge at European and international levels, there has been increased support for research activities within the maritime field over the FPs (Figure 1).

The Framework Programme needs to be complemented with substantially increased Member State investment and stronger connection between research and society

Stakeholders engagement and specific attention paid to communication beyond the scientific community are essential to achieve uptake of research results

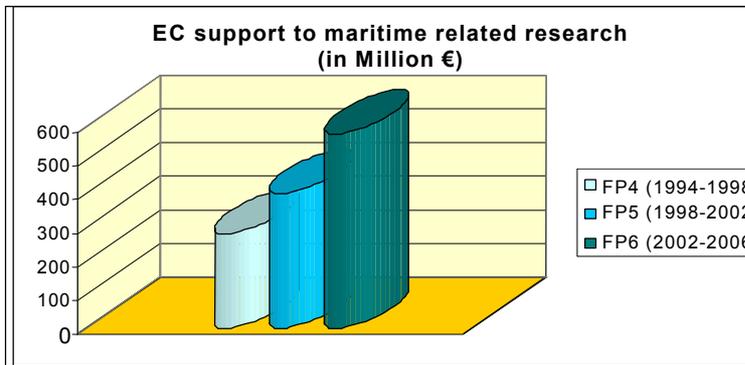

Fig. 1

A significant amount of EC RTD funding has been devoted to marine-related research projects in FP6

Although maritime research is not a single thematic priority within FP6, a wide range of marine related research activities are undertaken under the different thematic priorities managed by Directorates responsible for Ecosystems, Sustainable Transport and Energy, Space, Biotechnology, Food Quality and Safety, International Cooperation and research for Policy Support (reflecting its cross cutting nature).

An analysis of these activities shows that within FP6 more than 550 M€ of European funding has been provided to date towards research projects in the maritime domain (Figure 2).

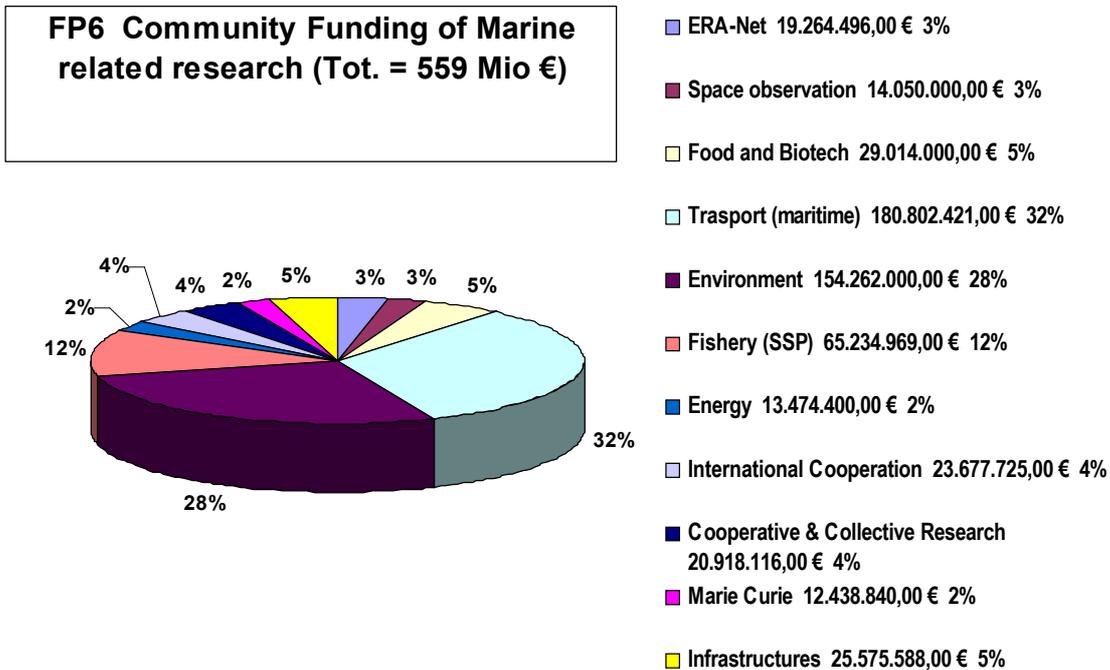

Fig.2

Within FP6 emphasis is given to activities enhancing and structuring synergies within the ERA. A significant instrument in building the ERA is the “ERA-NET” scheme. Initiatives such as BONUS (Baltic Sea Science Network of funding agencies) and

Marine-ERA (Marine RTD programmes in Europe) stimulate and support programme coordination and joint activities at both national and regional levels.

FP6 introduced new concepts and tools, such as the Networks of Excellence, to better structure thematic research domains by supporting long-lasting collaborations and integration and Integrated Projects, aimed at gathering the necessary multidisciplinary critical mass around a specific research theme. (Ref project show case: EUR-OCEANS; MERSEA).

Error!Box 1

Galway Declaration

This is an initiative following the 2004 Galway European conference, lead by the Irish EU presidency and bringing together environmental research bodies and commercial operators on a common declaration concerning Marine research.

The Galway declaration calls on the European Commission and the Member States to recognise:

the crucial role of the oceans in climate patterns, carbon cycle and Life on Earth;

the major contribution that maritime industries can make to the achievement of the objectives outlined in the Lisbon Agenda;

the essential role of marine science and technology in generating the knowledge needed to fuel this economic achievement in harmony with the environment;

the critical role the European Research Area and the 7th research Framework Programme must play in supporting the world-class excellence in marine science and technology.

<http://www.marine.ie/media+centre/press+releases/archive/historic+galway+declaration+on+europes+oceans.htm>

The Seventh research Framework Programme (FP7)

The Commission's ambitious proposals for FP7 are designed to meet the needs of the Lisbon Strategy to build a Europe of Knowledge. FP7 represents a flagship programme for enhancing knowledge in Europe with considerable potential for partner countries and regions as well.

The core of the proposed FP7 is the “Cooperation”

Cross-cutting relevance of

marine and maritime issues in the “Cooperation” Specific Programme which will support research in a number of thematic areas corresponding to major fields of knowledge and technology where trans-national cooperation can address European social, economic, environmental and industrial challenges.

Programme

Research relating to marine and maritime issues are integrated into all of the Themes, in particular those on Food, Agriculture and Biotechnology; on Environment (including Climate Change) and on Transport (including Aeronautics), but also the other Themes.

The definition of the research to be supported under the Themes builds upon the inputs received from a wide range of stakeholders, such as contributions from policy Directorates General, international commitments of the Union, and Technology Platforms. In the context of maritime research, particularly relevant inputs were the Galway Declaration (cf. Box 1) and the WATERBORNE Technology Platform (cf. Box 2).

Support to collaborative research will be granted through a range of funding schemes The implementation of FP7 foresees both a need to coordinate marine and maritime research across the relevant Themes and the flexibility to respond to new policy needs as they arise¹.
This will be achieved by supporting collaborative research through a range of funding schemes: Collaborative projects, Networks of Excellence, Co-ordination/support actions.

The environmental relevant marine issues The Environment Theme will support research targeted at the sustainable management of the environment and its resources through advancing our knowledge on the interactions between the biosphere, ecosystems and human activities, and developing new technologies, tools and services, in order to address in an integrated way global marine issues.

Emphasis will be put on the prediction of climate, ecological, earth and ocean systems changes; and on tools and technologies for the monitoring, prevention and mitigation of environmental pressures and risks.

Research will also help to develop an ecosystem-based approach, “whereby human activities affecting the marine environment will be managed in an integrated manner promoting conservation and sustainable use in an equitable way of oceans and seas.” Marine spatial planning will also play an important role in developing the ecosystem-based approach to the management of Europe’s

marine resources.

In addition, coordination of national research programmes will be strengthened, including a possible initiative for a joint

1 It is explicitly mentioned that “special attention will be paid to priority scientific areas which cut across themes, such as marine science and technologies.”

2 “In implementing the multiannual framework programme, the Community may make provision, in agreement with the Member States concerned, for participation in research and development

programme according to art. 169 of the Treaty 2 concerning Baltic Sea research (cf. Box 3).

Furthermore, other relevant elements have been reinforced in the FP7 proposal, including promotion of researcher training and careers (within the “People” programme”) and strengthened support to European research infrastructure and new activities to address research potential at a regional level (within the “Capacities” programme). *European research Infrastructures*

The access to effective research infrastructures in Europe is a key factor in increasing competitiveness in both fundamental and applied research. A strategy on research infrastructures at European level provides added value by pooling talent, maximising resources and generating a strategic vision for research in the European Research Area. European support for infrastructure may be relevant to maritime research such as, for instance, support for marine research vessels, climate modelling super-computing facilities, a pan-European multi-disciplinary sea-floor observation network, etc.

The 7th research Framework Programme is designed to have strong links to other Community Programmes supporting the knowledge economy and society, in particular the proposed Structural Funds, the Competitiveness and Innovation Programme and the educational programmes. In order to achieve the desired level of impact, it will require stronger R&D efforts on the part of Member States, with more effective coordination between the EU, national and regional levels. *FP links with Structural Funds, Competitiveness and Innovation Programme and educational programmes*

4. THE WAY FORWARD

4.1. A vision for marine related research in Europe

In the marine sphere, there is a need for more science, more research and more knowledge to better understand the complex interactions between marine ecosystems, their resources and their sustainable exploitation, and also for more generalised engagement with and service to the public. Long-term data, better observation and data collection capacities are needed to *Need to tackle all aspects referring to the marine sphere in an integrated way*

provide the necessary input for science as well as interpretations and presentation of results and their implications that speak to policy-makers.

Better technology and innovation is needed to develop in a sustainable manner the huge wealth coming from ocean and sea-related activities.

programmes undertaken by several Member States, including participation in the structures created for the execution of those programmes”.

All these aspects must be tackled in an integrated way, taking into account environmental, industrial, energy, transportation, social, economic and regional development aspects. Such an approach will confirm Europe's leadership position fulfilling regional, European as well as global knowledge requirements.

4.2. Dialogue with societal actors and policy makers

Research is fundamental to foster a conscious dialogue with societal actors and an advised, fully informed decision-making process at governmental level.

One of the main challenges that policy-makers face when developing an integrated Maritime Policy is co-ordination between (a) different policy sectors, such as fisheries, environment, transport, energy, industry, etc. and (b) between demands expressed by different groups in society, not all of which are easily reconcilable.

An effective communication of scientific knowledge to decision makers and civil society

The same challenge is valid as regards research activities in order to provide integrated and independent advice based on excellence in the different marine sciences. The scientific community needs to provide science that will address subjects in a holistic manner, communicate them effectively and act on this from the early stages of the political process. This means closer co-operation of different Scientific/technological

institutions engaged in ocean affairs, ranging from coastal issues, ecosystem conservation and rehabilitation, shipbuilding, ship operation, oil and gas engineering to oceanography, hydrology, meteorology and biology, to space observation technology.

This also means that the knowledge about the fundamentals of the oceans and society produced by researchers need to be explained in ways that connect to the perceptions and experiences of other stakeholders in government, private enterprise and civil society who have their own historically grown experience with maritime affairs.

The International Council for the Exploration of the Sea provides impartial, reliable

For example, the International Council for the Exploration of the Sea (ICES) has gained a reputation for providing impartial, reliable scientific advice to fisheries and environmental policy. Its main role is to coordinate and promote marine research in the North Atlantic including adjacent seas such as the Baltic Sea and the North Sea. Furthermore, ICES provides advice and information on issues related to the marine ecosystem with focus on the impact of *fisheries*.

This includes some of the largest databases in the world on these subjects. It should also be noted that there is no similar organisation for the Mediterranean Sea or the Black Sea which provides the same quality of advice, and with the same impartiality and regularity. *scientific advice to fisheries and environmental policy*

An integrated and holistic approach should serve to achieve objectives at regional level (knowledge and technology related broad questions of common interest), European level (best use of research facilities, technology transfer, research in support of Community Policies) and global level (knowledge of international concern such as climate change, operational oceanography, polar, tropical and marine ecosystem research for restoration and conservation, Earth observation, ocean research, drilling, transport etc).

An integrated and holistic approach at all levels

4.3. Enhancing coordination

Coordination of cross-cutting maritime activities in line with the Maritime Policy is foreseen within FP7 with the aim of fostering cross-fertilization between themes and priorities. As the programme develops, these activities will be considered within the relevant Specific Programmes. In particular, in addition to collaborative research, the opportunity for Article 169 initiatives is now foreseen as well as technology platforms and the launching of new research infrastructures. Framework Programme 7 offers powerful tools to contribute to the Maritime Policy. The European Community Framework Programme acts as a catalyst, drawing together the European research community to make a stronger whole and maximise European added value for sustainable prosperity.

The European Community Framework Programme acts as a catalyst, drawing together the European research community

Within the context of the discussions on the Maritime Policy Green Paper, Europe should consider the need for a “Strategy for European marine related research” that would take into account all marine related research in Europe, both within the European Community RTD FPs and outside, in order to secure enhanced and sustained commitments to marine research and development in support of a European Maritime Policy. Such a strategy would contribute to avoiding the duplication of marine research and to closing gaps and creating synergies in this domain, thereby establishing a true European marine research area.

4.4. Exploiting research results for the benefit of European economy

It is commonly acknowledged that Europe produces almost one third of the world’s scientific knowledge. At the same time, Europe is less successful in converting these achievements into commercial technologies and socio-economic innovation.

The European paradox

Among the reasons are:

The slow co-evolution of a whole range of areas which need to reach a ‘tipping point’ before new technologies can be adopted on a broad front;

A relatively weak effort in communicating science on a sufficiently

broad front and in a manner that facilitates uptake, appropriation;

The “knowledge triangle”: research produces knowledge to be diffused through education and used and applied through innovation.

A growing gap between the perceptions of social actors about challenges and opportunities and those of researchers working on the fundamental of nature and society.

Europe’s competitiveness and growth must be based on creativity and ideas, on investment in people, institutions and a healthy environment, if Europe’s high social expenditure and environmental costs are to be turned into an asset. The focus must remain, if not be intensified, on improving the “knowledge triangle”: the way knowledge is produced through research, diffused through education and used and applied through innovation and policy implementation.

Public spending in RDI represents the best possible investment in Europe’s future.

The creation of a knowledge-based economy will allow the safeguarding of the European model of society, without having to find compromises between economic growth, social cohesion and environmental protection.

4.5. Communicating research - Raising public awareness

A better informed and more engaged public could lead to a transparent culture of explanation, consultation and dialogue, which means democratic governance based on a degree of trust. Foremost, researchers need to acquire better communication skills or seek support from people with such skills, as a constituent part of the way science needs to get done under today’s condition. Societal debate could naturally lead also to new avenues in science through new questions raised by concerned stakeholders.

The Green Paper “Towards a future Maritime policy for the Union: a European vision for the oceans and the seas” examines all activities linked to or impacting on the oceans and the seas. The wide consultation launched with this Green Paper is targeted to both stakeholders and the general public, with the aim of getting fresh input for the optimisation of the ways of getting most benefits from the oceans in a sustainable way.

Research is a cornerstone in the development of such a policy, therefore communicating research and engaging with the public is more than a priority. It is an obligation in order to put the potential of the oceans at the right level of public perception and to ensure that citizens experience the benefits of this common heritage of humankind and understand the need for public research into its better understanding and sustainable use.

Box 1

What do Europeans actually think about science?

Two Eurobarometer reports published in June 2005 demonstrated that 71% of EU citizens agree that collaborative research at EU level is growing in importance and 59% consider that the EU should spend more money on scientific research.

In spite of the overall result, some critical messages came out of the survey:

Europeans tend to resist some technologies. For example, 54% of Europeans consider that food made from genetically modified organisms is dangerous

Although there is an overwhelming recognition of what science and technology have done for society until now, people see also negative impacts, e.g. on environment and employment. A majority of people believe that computer technologies eliminate more jobs than they create

There is still a comprehension gap between science and society. Europeans feel badly informed and not very involved in science and technology issues. Efforts still need to be made to bring science and technology closer to people and foster communication between scientists and the public

This duality is also valid for the image Europeans have of scientists: people recognise the positive role scientists play in society but there is also some criticism of the way scientists' explain their achievements and handle information towards the public.

At the same time, 64% of Europeans agree that our economy can become competitive only by applying the most advanced technologies and acknowledge the role S&T play today in industrial development.

87% agree that science and technology have improved their quality of life and 77% believe they will continue to do so for future generations.

Europeans expect more investment in scientific research, both at national and at EU level, a more intensive collaboration between researchers in Europe, and more coordination between Member States, in which the EU must play a key role.

Regarding science and technology decision-making, 73% of EU citizens want politicians to rely more on expert scientists.

Box 2

The Waterborne Technology Platform

A European Strategic Innovation Alliance

In December 2003 the Maritime Industry Forum (MIF) initiated the process for the establishment of an Advisory Council for Waterborne Transport Research in Europe (subsequently named: WATERBORNE TP) functioning as a forum where all the stakeholders would agree on a medium to long term Vision ("Vision 2020"), assess the key challenges for the maritime industry and waterborne transport and operations, would formulate the R&D actions to be fulfilled for meeting these challenges in a Strategic Research Agenda (SRA), and would promote the mobilisation of the necessary resources.

The Technology Platform WATERBORNE TP was launched during the MIF-plenary on 25 January 2005 in Bremen, in the presence of Günter Verheugen, Vice President of the European Commission.

The European waterborne industry consists of thousands of companies as well as related organisations and bodies including: ship owners, barge owners, shipyards, equipment manufacturers and systems suppliers, classification societies, ports and port services, engineering services and other knowledge providers which all engage in a wide range of activities. Many of these individual companies are SME's; several are international leaders in their business and sub-sectors and intend to remain so.

Between them they serve Global and European supply chains through shipping services, operate passenger transport, offer the related infrastructures and logistics, provide coastal and other dredging works, provide ships and equipment, also for modern navies, as well as for the exploration and exploitation of the oceans, and, satisfy the demand for holidays and leisure at sea. At the same time, these industries hold many common elements, commercial interests and often also have a "customer-supplier" relation.

Stakeholders and Objectives

WATERBORNE TP includes all actors along the waterborne value chain: those who build ships, boats and their systems and equipment, those who use and operate them for transport and services, those who provide the related infrastructure and ports and those who organize the exploitation of ocean resources.

Apart from general business objectives and management, WATERBORNE TP is mainly building on the know-how of navigators, naval architects and marine engineers, who drive the development in all sub-sectors included in the technology platform.

The "Waterborne" Technology Platform is a consensus based forum. The objective of WATERBORNE TP is to bundle efforts of the European waterborne actors, to remain champions, in maritime transport, in the production of efficient and safe vessels as well as the related systems and equipment, in providing infrastructure and logistics for ports and waterways, in offshore technology and for leisure craft - to continue to create value and high qualification employment opportunities in Europe.

Consequently the platform is industry-driven but includes with the same importance universities and research institutes, EU member states, the European Commission and other stakeholders which are relevant to society as a whole.

The WATERBORNETP Strategy

The WATERBORNE TP strategy to build and consolidate the European maritime cluster's know how is developed in two complementary documents: the Vision 2020 and the Strategic Research Agenda (SRA). The Vision 2020 lays down the main challenges of WATERBORNE TP 's medium and long term vision. The SRA translates into concrete R&D milestones the necessary steps to achieve this vision.

Both Vision 2020 and SRA are tools rather than position papers and they necessarily need to be dynamic in order to accommodate modified scenarios and other changes, as often as necessary, to increase the likelihood of realisation of the Vision 2020. For this reason

both documents will be regularly reviewed, updated and widely distributed throughout the entire European waterborne industry, as a part of the WATERBORNE TP process.

Consensus is a major asset and a pre-requisite for the success of our strategy. In particular we make sure that the main elements of such strategy, the Vision 2020 and the SRA, are widely supported.

Box 3

ERA-NET BONUS for the Baltic Sea

Networking of Funding Agencies

Our oceans and seas have always put international co-operation to the test. Borders can be drawn on a map, but waves, currents and sea creatures go where they please! The marine environment is not subject to territorial waters, so its protection and sustainable development will always require international agreement.

Marine science in the Baltic Sea would particularly benefit from a coordinated approach of this kind. Nine countries surround this 422.000 km² Europe's largest internal body of water, and eight of these are EU Member States. European policies for the sustainable use and development of this heavily industrialized region must be founded on solid scientific knowledge. A coherent trans-national strategy is essential to ensure that research is cost-effective, of high scientific quality, and addresses the real needs of policy-makers and of the Baltic region's economy and people.

Despite a long history of co-operation between scientists from the countries bordering the Baltic, the strategic planning of national programmes was still not coordinated between countries.

Under the ERA-NET scheme, BONUS aims at creating a forum for joint oversight of national or international research programmes through the pooling of resources and the coherent planning of projects to complement policy development. BONUS will bring together all of the key research funding organizations: ten bodies representing eight countries, and one international organization. BONUS' goal is the creation of conditions for joint Baltic Sea research programmes which will substantially improve the effectiveness of environmental and sustainable development policies for the entire region.

Four work packages pave the way to fully integrated research programmes:

Take stock of ongoing research funding mechanisms, and ways of dissemination of results, with the purpose of sharing best practice among the participants. The partners also plan to create a central internet-based resource where researchers and funders can access information about current research, funding opportunities, databases and marine research facilities in the Baltic Sea region.

Bring about greater co-operation and collaboration between national programmes. The partners will analyse and remove the administrative and legal barriers that hinder joint programme and research activity. This process will lead to a coordinated use of research infrastructures. In addition, the participants will identify gaps in knowledge, both in terms of basic science and its management.

An action plan for joint activities that will direct the creation of joint research programmes and establish agreed procedures for the management and shared use of research facilities, and will set up a joint postgraduate training programme.

Complete the transition to joint research funding in the Baltic Sea. It will define management and decision-making systems for long-lasting co-operation at programme level.

Article 169 initiative - Joint Baltic Sea Research Programme - 'BONUS-169'

The consortium has signed the 'Letter of Interest' regarding a joint Baltic Sea research programme under Article 169, and firmer commitments are negotiated within respective ministries. More funding organizations will be invited to join the initiative in the near future, expecting possible funding under FP7, according to budget availability.

The activities of BONUS-169 are organized in eight work packages reflecting research related to redressing the major environmental, fisheries and ecosystem-related challenges in the Baltic Sea. Special emphasis is placed on the synthesis and dissemination of information concerning findings and products. The above-mentioned challenges in the Baltic Sea region are inherently linked to socioeconomic activities, such as agriculture, fisheries, coastal industries, power generation, coastal engineering and land reclamation, sand and gravel extraction, dredging and dumping of materials including litter and garbage, oil and gas exploration and production, shipping, and military activities. Thus, a special work package is dedicated to a 'Socio- and ecological economics' that encourages interdisciplinary research approaches concerning socioeconomic development and the sustainable utilization and conservation of ecological 'goods and services'.

Ecosystem conservation and fisheries management through Marine Protected Areas

Marine protected areas (MPA) are seen as an option for improving both fishery management and marine environmental protection. MPAs enhance the prospect for greater survival of animal and plant species and the preserved habitats are expected to provide for increased biodiversity. Although such theoretical benefits are often easily identified, there is little empirical evidence to demonstrate the real effectiveness of MPAs, due to insufficient information and MPA design, monitoring and evaluation tools.

Two projects PROTECT “Marine Protected areas as a tool for ecosystem conservation and fisheries management” and EMPAFISH “European Marine Protected Areas as tools for Fisheries management and conservation” funded under FP6 aim at providing European policy-makers with improved tools for the identification, design and management of MPAs as a tool to protect sensitive and endangered species and habitats against the effect of fishing

The main objectives of the projects are:

- * To review the effectiveness of different MPA regimes across Europe in protecting sensitive and endangered species, habitats and ecosystems from the effects of fishing.
- * To formulate integrated policy proposals and practical measures for establishing MPAs in the Atlanto-Mediterranean area.
- * To develop and evaluate indicators for assessing the biological and socio-economic effects and effectiveness of MPAs.

PROTECT (<http://www.mpa-eu.net>) focuses on specific ecosystems in the Baltic Sea (top-down controlled ecosystem dominated by cod -*Gadus morhua*- as the top predator, sprat -*Sprattus sprattus*- and herring -*Clupea harengus*- as its most important prey), the North Sea (a wasp-waist ecosystem - North Sea sand eel areas) and the North East Atlantic (deep sea coral reefs).

EMPAFISH (<http://www.um.es/empafish/index.php>) is organised in an integrated way between 14 partners with different background in ecology, fisheries, modelling and economics. It investigates the performance of different regimes of Marine Protected Areas based on 20 already well-established MPAs all over the Mediterranean (Italy, Spain, France, Malta), Azores and Canaries Islands through a set of appropriate tools and models (indicators, protocols, procedures, eco-modelling tools).

Main outputs will include provision of guidelines for the definition of objectives, design, location, management and monitoring of European MPAs, based on a multidisciplinary scheme, using the best empirical information available to date. Results and recommendations from these two projects will be communicated to a broad audience at a European scientific symposium on MPAs co-organised with ICES, to be held 25-28 September 2007 in Murca (Spain).

Box 5

Coastal and water management gets a boost from Marie Curie.

With support from the Marie Curie Programme, HR Wallingford, a renewed international research organization based in Oxfordshire, is making progress on a number of coastal and water-related issues, including the development of new guidelines for exposed jetties and risk assessment for flood and coastal defence systems.

WENTECH is a Marie Curie Industry Host Fellowship, under which research has been undertaken in three main areas:

Guidelines for the hydraulic design of exposed jetties

Risk assessment for flood and coastal defence systems for strategic planning

Post-project appraisal of Sustainable Drainage Systems.

Over the past four years, HR Wallingford has welcomed a total of four Marie Curie Fellows within the framework of its WENTECH project.

Exposed jetties:

Coastal trade activities rely on jetties for the shifting of marine cargo. Traditionally, these facilities are constructed in naturally sheltered locations or are protected by artificial breakwaters.

Recent years have seen demand increase for the development of large single-use industrial terminals, especially for the loading and unloading of liquid natural gas (LNG) and liquid petroleum gas (LPG). These terminals require deep water, but are often located in remote areas where there is no existing infrastructure, no wave shelter, and where the construction of new protective structures would not be cost effective.

Thus, modern jetties are now having to be built in such exposed locations, requiring new design and better understanding of the dynamics of wave-current-structure interaction.

Box 6

MARITIME ACTIVITIES UNDER COST & EUREKA.

Founded in 1971, COST is an intergovernmental framework for European Co-operation in the field of Scientific and Technical Research, allowing the co-ordination of nationally funded research on a European level. COST Actions cover basic and pre-competitive research as well as activities of public utility.

Actions related to the maritime sector, can be found in the following domains:

ENVIRONMENT:

Action 635: INTERCAFE: Conserving Biodiversity – Interdisciplinary Initiative to

Reduce pan-European Cormorant-Fisheries Conflicts

The successful protection of cormorants in recent years is causing a growing number of conflicts with commercial fisheries. To avoid these conflicts the achievements of research of cormorant ecology should be implemented in combination with practical fishing management policies. The main objective of the Action is to improve European scientific knowledge of cormorant-fisheries interactions.

METEREOLOGY:

Action 719: The use of geographic information systems in Climatology and Meteorology

GIS has shown a great potential in the fields of climatology and meteorology. The main objective of the Action is to broaden and enhance the potential of GIS in those fields by developing applications, with emphasis on the procedures and capabilities for integrating and adding value to data from various sources and on quality control and presentation of climate and other related data. The Action tries to foster European cooperation in the development of operational applications of GIS in meteorology and climate research and to strengthen the links between National Meteorological Services, the research community and GIS industry.

Action 720: Integrated ground-based remote sensing stations for atmospheric profiling

To study and forecast atmospheric phenomena at increasingly finer scales, both in research and operational activities, aerological measurements with adequate resolution in space and time are needed. Atmospheric numerical modelling at increasingly finer scales requires high-quality measurements with high temporal and spatial resolution. In this respect, ground-based remote-sensing techniques are best suited to complement existing measurement techniques with satellites, commercial aircraft and radiosondes. The Action works on the integration of various techniques into one profiling station, which will enable the improvement of the quality of standard outputs, control procedures and the derivation of additional parameters.

Action 722: Short range forecasting methods of fog, visibility and low clouds

Meteorological forecasting at a very short notice (up to 12 hours) is called nowcasting. Numerous customers, particularly from transport companies, request nowcasting of fog, which is a limiting factor concerning visibility. The main objective of the Action is to develop advanced methods for very short-range forecasts of fog, visibility and low clouds, adapted to characteristic areas and to user requirements. This overall objective implies the development of pre-processing methods of the necessary input data together with the development of the appropriate forecast models and methods and adaptable application software for the production of the forecasts.

Action 723: Data Exploitation and Modelling for the Upper Troposphere and Lower Stratosphere

The upper troposphere and lower stratosphere (UTLS) is the region of the atmosphere formed approximately 5 kilometres above and below the tropopause. This region of the Earth's atmosphere plays an important role in the Earth's climate and in possible climate

change. Several strong feedback mechanisms in the climate system are strongly influenced by the processes in the UTLS. The sparse knowledge of these processes is one of the weaknesses in current climate prediction. The Action is trying to advance the understanding of the state of the global UTLS, in order to provide an improved basis for policy advice in connection with global change.

Action 724: Developing the basis for monitoring, modelling and predicting Space Weather

Space Weather is succinctly defined as: “conditions on the sun and in the solar wind, magnetosphere, ionosphere, and thermosphere that can influence the performance and reliability of space-borne and ground-based technological systems and can endanger human life or health”. The impact of space weather ranges from technical problems with satellites arising from charged particles to problems experienced by power transmission grid operators on the ground during geomagnetic storms.

The main goal of the Action is to develop a European framework for the science underpinning space weather applications, as well as exploring methods for providing a comprehensive range of space weather services to a variety of users, based on modelling and monitoring of the Sun-Earth system.

AGRICULTURE:

Action 867: Welfare of fish in European aquaculture

The welfare of farmed fish is a subject of increasing concern within Europe. This Action is focussed on the provision of a secure foundation for the development of operational welfare indicators, in order to monitor and safeguard the welfare of farmed fish. Identifying and measuring welfare requires a better scientific understanding of the fundamental physiological and behavioural capacities of fish.

URBAN CIVIL ENGINEERING:

Action C22: Urban Flood Management

The main objective of the Action is to increase knowledge required for preventing and mitigating potential flood impacts to urban areas by exchanging experiences, developing integrated approaches, and by promoting the diffusion of best practices in Urban Flood Management.

CHEMISTRY:

Action D28: Natural Products as a Source for Discovery, Synthesis, and Application of New Pharmaceuticals

The main objective of the Action is the target-orientated discovery of new natural products with an important biological profile based on new and unusual sources, e.g., secondary metabolites of bacteria or marine organisms combined with efforts to synthesize these molecules by the use of novel strategies and methods. The development of new strategies to synthesize complex natural products is the second main objective. As a result, a broad screening of analogues will be possible. Structure activity data will then be used to further refine the pharmacophore model, enabling the rational design and synthesis of more

focused active compounds.

Action D33: Nanoscale Electrochemical and Bio-processes (Corrosion) at Solid-aqueous Interfaces of Industrial Materials

The main objective of the Action is to develop the understanding of biochemical processes at solid-aqueous interfaces leading to a universal approach to all biofouling related issues.

For more information on COST and individual Actions: <http://www.cost.esf.org/>

EUREKA is a pan-European network for market-oriented, industrial R&D.

A number of initiatives in maritime field are EUREKA labelled:

INNOFISK (UMBRELLA)

The InnoFisk Umbrella aims at the creation of a European-wide platform to combine research and development capabilities and expertise in order to generate projects in the area of fish breeding throughout the entire fish production chain, assuming sustainability and transparency as clear preconditions and reinforcing the all encompassing fork-to-farm approach in which high quality and safe food prevails. The following principles lie at the basis of the InnoFisk Umbrella: 1. Animal well-being: create a breeding environment with sufficient freedom of movement and minimise stress in order to avoid outbreak of diseases. 2. Sustainability: avoid environmental pollution and avoid the use of antibiotics and harmful chemicals. Make use of natural organic resources where possible and try to reach an optimal feed conversion ratio. 3. Biodiversity: avoid escapes of farmed fish to natural populations and find alternative solutions for the use of fishmeal and fish oil. 4. Consumer acceptance: produce high quality farmed fish with a good texture and make the fish farming chain transparent, for instance by developing a hallmark.

LOGCHAIN (UMBRELLA) - Building of Advanced Freight Chains and Logistics Technology

LOGCHAIN is aimed at improving international freight transport within Europe through the development and optimisation of continuous logistic chains between shipper and receiver. This can be achieved by integrating innovative techniques, advanced forms of organisation, efficient operating procedures, and novel IT applications. Central to the initiative is the concept known as intermodal transport - a mixture of different modes of transportation (road, rail and inland waterways). The overriding political objective of LOGCHAIN is to shift freight traffic from Europe's roads and highways to rail and waterways. It provides actors in the European transport sector and transport research community with a platform for launching co-operative research projects aimed at redesigning cross-border freight transport in such a way so as to make it friendlier to the environment, more efficient, and more customer-oriented (www.eureka.be/logchain).

EUROGIA (Cluster) - Eureka Oil & Gas Industry Initiative for Sustainable Development And A Secure Energy Supply In A Cleaner/Safer Future

EUROGIA is an Oil and Gas Industry Initiative for sustainable development and a more secure energy supply, for a cleaner and safer future. EUROGIA's primary purpose is to initiate the technological developments that are fundamental to ensuring a better management of fossil fuels, in order to facilitate a rapid migration towards the hydrogen economy. This will be achieved in the two following ways: - Reserves management optimisation by adding up new reserves is, therefore, an essential element of the energy strategy. - Decarbonisation of the fossil energy chain, moving instead towards a wider use of natural gas and in the long term - migration towards the hydrogen economy. EUROGIA was initiated by a group of European industrialists representing the largest possible market segments. They are supported by public and private research institutes specialised in the accompanying disciplines of geosciences, information technology, materials, fluids mechanics, marine science, etc. (www.eurogia.com).

Individual projects:

E!3194- FORCE 8 - Broadband Satellite Services And Technologies For Maritime Communications Duration: 36 months Total Cost: 3,09 M€

The Project Aims Are To Provide Broadband Satellite Services For Maritime Environments, Based On Standards And Infrastructure Of European Satellite Network Operators (Ip, Dvb, Mpe). It Will Use Innovative Antenna Technologies.

E!3065- INCOWATRANS - Environmentally Friendly Inland And Coastal Ships For Polish East-West Waterways – Duration: 43 months Total cost: 7,00 M€

Study Of The Technical Conditions Of Polish Inland And Coastal Waterways And Its Modernisation Perspectives, Economical Analysis Of Transport Conditions And Needs. Development Of Environmentally Friendly Inland Waterway And Coastal Ships.

E!3593- SAFEPASEA - Safe Passenger Transport At Sea – Duration: 21 months Total cost: 3,1 M€

Develop And Validate Methodologies And Tools For The Safer Design, Construction And Operations Of The Next Generation Of Cruise And Ferry Ships With Specific Attention To Propulsion And Steering Devices.

E!3509 - EUROAGRI+ SLURRY ICE (Sub-umbrella) - Advanced Technology For A Compact, Low Energy Expenditure Wiped Surface Crystalliser System - Duration: 12 months Total cost: 0.5 M€.

To Develop A New Wiped Surface Crystalliser System, Which Produces Liquid Slurry Ice Using Innovative Technology. The Product Will Have Small Dimensions Making It Suitable For Installation In Supermarkets And Fishing Vessels, Thus Using A Minimum Amount Of Valuable Space.

E!2278- WWEC - R&Td For The Wavebob Wave Energy Converter (Finished-19-Aug-2002)

Duration: 12 months Total cost: 0,5 M€

Wavebob is a novel wave energy-converter that generates up to three times more power from the sea than previous models. With the buoy placed far off shore, it can be rapidly tuned to the waves' frequency for maximum efficiency.

E!2600 SALINITY POWER - Power Production Based On The Osmotic Pressure Difference Between Fresh Water And Seawater (Finished-18-Oct-2004) – Duration: 43 months – Total costs: 2.69 M€

The Objective Is To Develop A Technical Foundation For The Development Of Salinity Power As A Competitive Power Source For The Production Of Electricity.

E!2835 SAFENVSHIP - Safe And Environmentally Friendly Passenger Ships – Duration: 42 months – Total costs: 15.33 M€

Develop, Evaluate And Validate Methodologies And Tools For Design Of The Next Generation Cruise/Ferry Ships Related To: 1. Safety: Fire Protection, Structural (Hydroelasticity), Wind Effects/Evaluation. 2. Environment: Clean Sea/Air.

E!2326 GPSFISH - Positioning System For Marine Fauna–Duration: 36 months– Total costs:0.89 M€

Fish Are Tagged With A Positioning Tag Which Can Receive Acoustic Sounds Transmitted By Sonar. By Modulating The Signal With The Gps Position, The Tag Attached To The Fish Can Receive The Sonar Position And Define That Position.

E!2772 BALTECOLOGICALSHIP – Environment Friendly Ships For Baltic Area - Duration: 38 months – Total costs: 7.12 M€

Development Of Environment Friendly Diverse Cargo Ship Types, Ecological Construction Processes, Technological And Business Risk Management Models And Cost Effective Polish/ Swedish Infrastructure.

For more information about the Eureka initiative: www.eureka.be

PROJECT SHOWCASE

This section is aimed at illustrating the impact of research on the various challenges faced by Europe through some examples of FP funded projects. The examples show as well how the different programmes contribute to common goals.

Environment and societal goals:

Climate change, Pollution, natural and man-made phenomena and hazards

HERCULES: Creating cleaner, more energy efficient marine engines

The integrated project HERCULES project is develops new technologies to reduce emissions from marine engines and increase engine efficiency and reliability, thereby reducing fuel consumption, CO2 emissions and engine lifecycle costs. The objective is to reduce by 2020 related NOx emissions by 60% and to reduce other components (such as particulates) by 40%. This is achieved through developments in thermodynamics and mechanics of "extreme" parameter engines, advanced combustion concepts, multistage intelligent turbo charging, "hot" engines with energy recovery and compounding, internal emission reduction methods and after treatment techniques as well as new sensors.

SAFEDOR: Safety and security for waterborne transport

SAFEDOR is an integrated project that will provide solutions to increase the safety and security of waterborne transport cost-effectively by treating safety as a design objective, not as a constraint. A risk-based regulatory framework will link performance prediction with risk assessment. Using state-of-the-art first-principle analysis tools within an integrated and holistic design approach, partners believe a balance between costs, safety and performance can be achieved. In the end, risks will be reduced to as low as reasonably practical whilst accounting for other design priorities and constraints. (<http://www.safedor.org>)

BIOTAXMARIN: Tools for risk management and traceability systems for marine biotoxins in seafood

Outbreaks of poisoning from eating shellfish with toxins accumulated in their tissue have become a world-wide problem with significant economic consequences for the coastal population. Fast, simple and cost-effective detection methods for marine biotoxins in food as well as in patient sera will allow mitigating the consequences of such outbreaks that are often caused by environmental pollution of the coastal waters. Innovative biosensor technology in combination with user-friendly chip assay methods will enhance competitiveness of European industry.

DAMOCLES: Arctic Modelling and Observation for Long-term Environmental Studies

Damocles is an integrated project that addresses uncertainties concerning the rate and the predicted possible disappearance of arctic sea ice and the consequent social economic impacts. The effect of this disappearance would be a 40% increase in the summer heat absorbed by the arctic ocean, the large environmental consequences of this change would particularly impact on the inhabitants of Europe, north America and Russia. Damocles brings together 47 institutions (including 10 SME's) in 12 EU countries to identify the on

going changes, evaluate the confidence in simulation models and predict the socio economic impacts. Ultimately the project will increase the timeframe for the forecasting of extreme environmental events in the Arctic and consequently improve societies ability to mitigate for their impacts.

QUANTIFY: Quantifying the impact on climate from European Transport Systems

The integrated project Quantify determines the impact on climate globally from European transport modes concerning both the current situation and for a number of future scenarios. Of particular interest are emissions of ozone precursors, CO₂, N₂O, and particulates from shipping. In addition the project examines contrails and ship tracks. The project is expected to contribute to better emission inventories and provide a sound underlying body of knowledge to support policy.

CARBOOCEAN: Marine carbon sources and sinks assessment

This integrated project aims at an accurate assessment of the marine carbon sources and links. Its targets include reducing the present uncertainties in the quantification of net annual air-sea CO₂ fluxes of the world ocean. The IP will deliver description, process oriented understanding and prediction of the marine carbon sources and sinks with special emphasis on the Atlantic and Southern Oceans on a time scale -200 to +200 years from now. The project is based on three elements -observations, process studies, and integrative modelling- equivalent to description, understanding and prediction: a marine carbon balance for the last 200 years based on high quality observations; a process-based understanding of the marine carbon cycle response to a change in forcing as derived from process studies in the field, in the laboratory, and through modelling; integrated carbon budgets for the interval - 200 to + 200 years from now by synthesis of a modelling network.

(<http://www.carboocean.org/>)

Competitiveness

Sustainable economic and wealth generation

InterSHIP: Improving European shipbuilding

InterSHIP is an EU-funded project aimed at increasing EU shipbuilders' competitiveness by improving the integration of tools and methods used to design and manufacture complex vessels. It will enable shipyard engineers to analyse simultaneously leading-edge knowledge in environmental aspects, safety, comfort and cost-efficiency, ensuring that optimum solutions can be obtained for the total life cycle of vessels such as cruise ships or gas carriers. The project brings together a significant proportion of the European production capacity and proposes a programme that will advance the integration of production processes in shipyards and reinforce future research and industrial co-operation among Europe's shipyards.

SEAFOODplus: The consumer driven concept for health promoting, safe and high quality seafood

The benefits to human health of eating regularly seafood have led to an increase in fish farming and market demand, which needs to be further developed by maintaining quality

and safety of farmed and caught seafood and tailoring products to consumers' wishes. The concentration on six main themes (seafood and nutrition, consumer health, safety and risk-benefit analysis, new products, aquaculture, traceability) will allow promoting the production, marketing and consumption of better safer fish of all kinds.

CHITOMED: Seafood waste that heals

The processing of shrimp and similar crustaceans by the seafood industries generates large volumes of shells, generally as a waste product. However, this material contains a potentially useful chemical, chitin, an abundant biodegradable fibrous polymer that could be used in a number of industrial and medical applications. The CHITOMED project is investigating the production of Biomedical Textiles from Dibutrylchitin and Chitin, aiming to produce biocompatible dressings that will aid the healing of wounds.

ENDOW: Efficient offshore wind farms

Europe has large offshore wind energy potential that can contribute substantially to providing a clean, renewable and secure supply of energy. The ENDOW project will reduce uncertainties in estimating power production due to wake effects in large offshore wind farms. By evaluating wake models in offshore environments, ENDOW will produce a tool that can assist planners and developers in getting the most out of offshore wind farms.

Wave Dragon: Turning waves into energy

Offshore waves carry a great deal of power. The Wave Dragon project is developing ways to turn wave power into clean energy. The concept is based on a wave energy converter. Two wave reflectors focus the incoming waves towards a ramp leading to a reservoir that collects the sea water. The water reservoir flows out through hydro turbines, like a hydropower plant. The main aims are the development and testing of the floating structure, of small head hydro turbines operational in sea water and of a control strategy to maximise power generation. A prototype was built and launched in a Danish fjord and connected to the grid, becoming the world's first offshore wave energy plant to deliver electricity.

Virtue: Virtual Tank Utility in Europe

VIRTUE will develop new and improved components and software tools to deliver concise and comprehensive numerical analysis of marine hydrodynamic behaviour. It constitutes an EU-wide initiative of leading marine CFD players to create a "Virtual Basin" by integrating advanced numerical fluid analysis tools to tackle multi-criteria hydrodynamic performance optimisation of ships in a comprehensive and holistic approach, aiming to complement model testing in real basins and hence substantially enhance the provision of current services to the marine industry and to nurture development of innovative design techniques and concepts. This will help increase the competitiveness of the EU shipbuilding and shipping industries, promote a truly European co-operation with strong structuring and integration effects, strengthen SMEs through involvement in leading edge developments as a means to gaining and sustaining competitive advantage and leadership and enhance quality and safety in waterborne transportation.

Improved understanding of the Marine Environment and supporting Infrastructure

SeaDataNet: A Pan-European infrastructure for Ocean & Marine Data management
SeaDataNet is an Integrated Infrastructure Initiative (I3) that brings together a group of 47 major oceanographic institutes from 36 countries bordering the Baltic, the Black Sea, the Mediterranean and the North-East Atlantic, to develop a distributed pan-European marine data management infrastructure -. All the partners are skilled in marine data management and added value services covering physical oceanography, marine biology and marine chemistry. SeaDataNet will incorporate and enhances, the currently existing marine data information infrastructures in Europe. The networking in a unique virtual data management system will provide on-line access to integrated data sets from the various sources. (<http://www.seadatanet.org/>).

HERMES: Hotspot Ecosystem Research on the Margins of European Sea

Hermes is an integrated research project that is designed to gain new insights into the biodiversity, structure, function and dynamics of ecosystems along Europe's deep-ocean margin. The Project brings together expertise in biodiversity, geology, sedimentology, physical oceanography, microbiology and biogeochemistry, so that the generic relationship between biodiversity and ecosystem functioning can be understood. Study sites will extend from the Arctic to the Black Sea and include open slopes and biodiversity hotspots, such as cold seeps, cold-water coral mounds, canyons and anoxic environments. (<http://www.edu-hermes.org/>).

EMSO: European Multi-disciplinary Seafloor Observatory

A major new element of the proposals is the strategic approach that is foreseen to support the construction of new research infrastructure that will complement the continued support for optimal use of existing research infrastructure. The European Strategy Forum on Research Infrastructures (ESFRI) has identified EMSO as a candidate research infrastructure. ESFRI noted that through the concerted action ESONET (“The European Sea-floor Observatory Network”) and an existing fleet of seafloor observatories, e.g. GEOSTAR, ASSEM, etc., the European deep-sea observatory community has matured and is ready to establish a multi-disciplinary seafloor observatory network to be integrated with land-based and satellite networks.

MARBEF: Marine Biodiversity and Ecosystem Functioning

The MARBEF network will address the long and large scale changes in marine ecosystems including the rising of anthropogenic pressures on marine biodiversity. The creation of this network aims at integrating research efforts by forming a particular group of marine scientists and institutes and creating a virtual European institute with a long-term research programme and dedicated links with industry and the public at large. MARBEF will also contribute to fill gaps in the information needs of a large and growing number of stakeholders that depends on the sustainable use and exploitation of marine biodiversity. This includes tourism, fisheries and aquaculture but also new industries that explore and commercialise marine genetic and chemical products. (www.marbef.org/).

Towards coordination and structuring ERA

ERA-NET MarinERA: the ERA-NET coordinating national and regional marine RTD programmes in Europe

MarinERA brings together 13 of Europe's leading marine science funding agencies responsible for a combined annual investment of some 100 million euro. With the participation of a further seven international research organisations and two national bodies almost all European maritime nations are represented. MarinERA maps European marine research programmes, improves networking, contributes to development of European marine science research policy, provides a basis sharing resources and addresses issues beyond the capabilities of individual Member States, promotes mutual opening of national marine research programmes. (<http://www.marinera.net/>)

Network of Excellence of EUR-OCEANS

EUR-OCEANS seeks to achieve lasting integration of European research organisations within the fields related to global change and pelagic marine ecosystems. 160 researchers within EUR-OCEANS are now scattered in 69 Member Organisations, located in 25 countries. These researchers belong to three research communities (pelagic ecosystems, biogeochemistry and marine resources) which have often worked independently. Bringing these research organisations and excellent researchers together within the EUR-OCEANS Network is expected to establish Europe as a leader within the field. (<http://www.eur-oceans.org/>)

HTA: An alliance to enhance the maritime testing infrastructure in the EU.

This Network of Excellence aims at structuring the European Marine Testing capacity. The target is to build a lasting and complimentary relationship between major marine testing facilities and shipbuilders so as to provide Europe and its researchers with a complete, comprehensive, efficient and integrated set of advanced marine testing services (including inland navigation) and that will define R&D priorities in marine testing. This will ensure Europe's world lead within the field of marine testing and as a consequence contribute to a successful European waterborne transport sector.

The International Dimension of Marine Research

SPEAR - Sustainable options for PEople, catchment and Aquatic Resources

SPEAR aims to develop and test an integrated framework for interpreting coastal zone structure and dynamics, in areas where communities primarily depend on marine resources. This framework accounts for watershed interactions, ecological structure and human activities. The interdisciplinary approach combines natural and social sciences, and addresses the complex scaling issue inherent in integrated management.

Two contrasting systems in China are being studied: Sanggou Bay, part of a rural watershed, and Huangdun Bay, located in an industrialized area south of Shanghai. In both systems, large-scale cultivation of seaweeds, shellfish and finfish are of paramount importance for community income and livelihood.

INCOFISH - Reconciling multiple demands on coastal zones with emphasis on aquatic ecosystems and fisheries

This international S&T cooperation focuses on conducting specifically targeted strategic research suitable to contribute to the goals set by the World Summit for Sustainable Development in Johannesburg, such as restoring healthy fish stocks and ecosystems by

2015. 35 research institutions and private enterprises from 22 nations worldwide (12 European, 12 Latin American, 6 Asian, 5 African) participate in 10 workpackages: Data, Tools and Outreach; Shifting Baselines; Biodiversity Mapping; Ecosystem Modelling; Marine Protected Areas; Coastal Transects; Indicators for Sustainable Fisheries; Valuation of Coastal Ecosystem Products and Services; Impact of Ecotourism on Ecosystems; Legal Instruments for Sustainable Fishing.

The tools and concepts resulting from INCOFISH research will be tested in real-world scenarios in selected coastal systems worldwide. They will together form a package with the potential to impact on solving societal problems in the coastal zone in Europe and in developing countries. All data and tools will be available online at www.incofish.org.

Research in support to Policy in FP6

UNCOVER: Understanding the mechanisms of Stock Recovery

Many EU fish stocks are defined as being outside of safe biological limits. UNCOVER investigates the failures and successes of previous stock recovery activities and tries to define optimal strategies for recovery plans for the future. The main objectives of UNCOVER are to identify changes experienced during stock decline and their consequences for the prospects of stock recovery, to enhance the understanding of mechanisms of fish stock recovery, and to provide recommendations for the recovery of EU fish stocks. Results will be integrated into a modelling framework in order to evaluate and develop management strategies incorporating biological and environmental factors as well as technical and socio-economic constraints. Recovery strategies developed in UNCOVER will be area- and ecosystem-specific and tuned to key species and their fisheries in the Barents Sea, North Sea, Baltic Sea and the Bay of Biscay.

AQUAFIRST: Combined genetic and functional genomic approaches for stress and disease resistance marker assisted selection in fish and shellfish

The overall aims of the project is to identify, in sea bream, sea bass, oyster, and rainbow trout, genes of which expression is associated with disease and stress resistance and, from this information, to develop genetic approaches that allow characterisation of genetic markers for marker-assisted selective breeding of disease and/or stress resistant individuals. For such project, the following main objectives will have to be reached:- Characterisation in sea bream, sea bass, trout and oyster, stress- and disease-responsive genes as potential candidate gene markers for desirable traits.- Seeking associations between (i) variations in response to stress and resistance to pathogen and (ii) selected candidates genes and microsatellites markers by segregation analysis in appropriate families (QTL analysis).- mapping of these genes in linkage and gene maps. (<http://aquafirst.vitamib.com>)

LIST OF FP6 FUNDED PROJECTS IN THE MARITIME SECTOR

(Total funding =558.710.128 €)

ERA-NET (Coordination Actions) – Total funding: 19.264.469 €

BONUS	BONUS for the Baltic Sea - Network of funding agencies	3.029.453 €
ECORD	European Consortium for Ocean Research Drilling	2.375.592 €
MarinERA	Co-ordination of National and Regional Marine RTD Activities in Europe	2.954.000 €
AMPERA	European Concerted Action to Foster Prevention and Best Response to Accidental Marine Pollution	1.678.315 €
BiodivERsA	An ERA-Net in Biodiversity Research	2.839.440 €
EUROPOLAR	The European Polar Consortium: Strategic Co-ordination and Networking of European Polar RTD Programmes	2.999.994 €
COASTAL	Control Objectives and Shellfish Target Assurance Levels	187.702 €
CIRCLE	Climate Impact Research Coordination within a Larger Europe	200.000 €
CRUE	Co-ordination of Research Financed in the EU on Flood risk Management	3.000.000 €

SPACE (Priority 1.4) – Total funding: 14.050.000 €

MERSEA	Marine Environment and Security for the European Area	14.050.000 €
---------------	---	--------------

FOOD (Priority 1.5) – Total funding: 29.014.000 €

	Integrated Projects (IP)	
SEAFOODplus	Health promoting, safe seafood of high eating quality in a consumer driven fork-to-farm concept	14.400.000 €
Imaquanim	Improved immunity of aqua cultured animals	8.019.000 €
	Specific targeted research or innovation projects (STREP)	

BIOTOXMARIN	Development of novel analytic tools for the detection of marine bio toxins	1.325.000 €
DETECTOX	Development of an SPR-based biosensor for the detection of lipophilic phycotoxins in shellfish residues	812.000 €
BIOTOXMARIN	Development of cost-effective tools for risk management and traceability systems for marine biotoxins in seafood	3.008.000 €
	Coordination Actions (CA)	
CONSENSUS	Consensus	1.450.000 €

TRANSPORT (Priority 1.6.2) – Total funding: 180.802.421

	Integrated Projects (IP)	
HERCULES	High Efficiency Engine R&D On Combustion With Ultra Low Emissions For Ships	15.000.000 €
InterSHIP	Integrated Collaborative Design And Production Of Cruise Vessels, Passenger Ships And Ropax	19.000.000 €
SAFEDOR	Design, Operation And Regulation For Safety	12.000.000 €
VIRTUE	The Virtual Tank Utility In Europe	10.500.000 €
EFFORTS	Effective Operation In Ports	8.000.000 €
FLAGSHIP	European Framework For Safe, Efficient And Environmentally-Friendly Ship Operations	10.215.000 €
MC-WAP	Molten-Carbonate Fuel Cells For Waterborne Application	9.900.000 €
MarNIS	Maritime Navigation and Information Services	11.995.615 €
	Networks of Excellence	
MARSTRUCT	Network Of Excellence In Marine Structures	6.000.000 €
VISIONS	Visionary Concepts For Vessels And Floating Structures	5.000.000 €
HTA	An Alliance To Enhance The Maritime Testing Infrastructure In The EU	6.500.000 €
	Specific targeted research or innovation	

	projects (STREP)	
CREATING	Concepts To Reduce Environmental Impact And Attain Optimal Transport Performance By Inland Navigation	2.700.000 €
DSS-DC	Decision Support System For Ships In Degraded Condition	2.400.000 €
ECODOCK	Environmentally Friendly Coatings For Ship Building And Ships In Operation	2.000.000 €
LOGBASED	Logistics-Based Design	1.900.000 €
NG2SHIPI/F	New Generation Natural Gas Ship Interfaces	2.000.000 €
POP&C	Pollution Prevention And Control Safe Transportation Of Hazardous Goods By Tankers	1.600.000 €
ROTISII	Remotely Operated Tanker Inspection System Ii	1.700.000 €
SAFECRAFTS	Safe Abandoning of Ships, Improvement of current Life Saving Appliances Systems	2.900.000 €
SAFEICE	Increasing The Safety Of Icebound Shipping	1.100.000 €
SAFETOW	Strategic Aid For Escort Tugs At Work	1.300.000 €
SHIPMATES	Ship repair To Maintain Transport Which Is Environmentally Sustainable	2.300.000 €
ADOPT	Advanced Decision Support System For Ship Design, Operation And Training	1.900.000 €
CAS	Cost Effective Inspection And Structural Maintenance For Ship Safety And Environmental Protection Throughout Its Life Cycle	1.600.000 €
DIFIS	Double Inverted Funnel For Intervention On Ship-Wrecks	1.800.000 €
EU-MOP	Elimination Units For Marine Oil Pollution	1.900.000 €
GIFT	Gas Import Floating Terminal	2.300.000 €
HISMAR	Hull Identification System For Marine Autonomous Robotics	1.100.000 €

OSH	Oil Sea Harvester	2.000.000 €
SAFE OFFLOAD	Safe Offloading From Floating Lng Platforms	2.000.000 €
ShipDismantl	Cost Effective And Environmentally Sound Dismantling Of Obsolete Vessels	1.500.000 €
SUPERPROP	Superior Life-Time Operation Economy Of Ship Propellers	1.000.000 €
BaWaPla	Sustainable Ballast Water Management Plant	1.700.000 €
CHINOS	Container Handling In Intermodal Nodes - Optimal And Secure	1.500.000 €
Cleanmould	Boat Hulls With Enhanced Performance	1.400.000 €
CREATE3S	Production To Improve Total Efficiency Of New Generation Short Sea Shipping	2.500.000 €
DE-LIGHT Transport	Developing Lightweight Modules For Transport Systems Featuring Efficient Production And Lifecycle Benefits At Structural And Functional Integrity Using Risk Based Design	2.500.000 €
HANDLING WAVES	Decision Support System For Ship Operation In Rough Weather	1.700.000 €
IMPROVE	Design Of Improved And Competitive Products Using An Integrated Decision Support System For Ship Production And Operation	2.500.000 €
OFIENGINE	Development Of The New Thermal Spraying Equipment And Technology For Production Of Components For Marine Transport Engines	1.000.000 €
POSSEIDON	Progressive Oil Sensor System For Extended Identification On-Line	1.200.000 €
SECURCRANE	Design Of An Innovative System For The Drive And Control Of Port Cranes For Safe Remote Operation	2.200.000 €
SMOOTH	Sustainable Methods For Optimal Design And Operation Of Ships With Air-Lubricated Hulls	1.500.000 €
	Coordination Actions (CA)	
INMARE	Technologies And Methodologies For Safe, Environmental-Friendly And Efficient Shipping	800.000 €

	Operations Of The Future	
ACMARE (CA)	Co-Ordination Action To Implement An Advisory Council For Maritime Transport Research In Europe	1.000.000 €
CAREMAR	Coordinated Academic RTD And Education Supporting Innovation In Marine Industries	700.000 €
SPREEX	Spill Response Experience	900.000 €
ALERT	Assessment Of Life-Cycle Effect Of Repairs On Tankers	600.000 €
CAPOEIRA	Coordination Action Of Ports For Integration Of Efficient Innovations And Development Of Adequate Research, Development And Innovation Activities	500.000 €
MTCP	Maritime Transport Co-ordination Platform	2.740.660 €
	Specific Support Actions (SSA)	
CRONET-DAYS	Promoting And Facilitating Era-Networking Between European Contract Research Organisations (C.R.O.)	50.000 €
ENCOMAR TRANSPORT	Enhanced Co-Operation Between EU Member States And Associated Candidate States In Maritime Research On Transport	300.000 €
ICOMOB	Icebreaker Cooperation On The Motorway Of The Baltic Sea	143.000 €
EUROMAR-BRIDGES	Building Bridges Between EU Member And Candidate States In Maritime Research On Transport Within The Frames Of European Research Area	258.146 €

ENVIRONMENT (Priority 1.6.3) - Total funding: 154.262.000 €

	Integrated Projects (IP)	
CARBOOCEAN	Marine carbon sources and sinks assessment	14.500.000 €
HERMES	Hotspot Ecosystem Research on the Margins of European Seas	15.000.000 €
MODELKEY	Models for Assessing and Forecasting the Impact of Environmental Key Pollutants on Marine and Freshwater Ecosystems and	8.400.000 €

	Biodiversity	
DAMOCLES	Developing Arctic Modelling and Observing Capabilities for Long-term Environmental Studies	16.100.000 €
SESAME	Southern European Seas: Assessing and Modelling Ecosystem Changes	10.000.000 €
SPICOSA	Science and Policy Integration for Coastal System Assessment	10.000.000 €
ECOOP	European coastal-shelf sea operational observing and forecasting system	7.000.000 €
	Networks of Excellence	
EUR-OCEANS	European network of excellence for ocean ecosystems analysis	10.000.000 €
MARBEF	MARINE BIODIVERSITY AND ECOSYSTEM FUNCTIONING	8.710.000 €
MARINE GENOMICS	Implementation of high-throughput genomic approaches to investigate the functioning of marine ecosystems and the biology of marine organisms.	10.000.000 €
EDIT	Towards the European Distributed Institute of Taxonomy	11.900.000 €
ESONET	European Seas Observatory NETWORK	7.000.000 €
	Specific targeted research or innovation projects (STREP)	
COBO	Integrating new technologies for the study of benthic ecosystem response to human activity: towards a Coastal Ocean Benthic Observatory (COBO)	2.000.000 €
ELME	European Lifestyles and Marine Ecosystems	2.500.000 €
ESTTAL	EXPRESSED SEQUENCE TAGS (ESTS) OF TOXIC ALGAE	1.400.000 €
FISH & CHIPS	Towards DNA chip technology as a standard analytical tool for the identification of marine organisms in biodiversity and	1.600.000 €

	ecosystem science	
HABIT	Harmful Algal Bloom species in Thin Layers	950.000 €
SEED	Life history transformations among HAB species, and the environmental and physiological factors that regulate them	1.500.000 €
EXOCET/D	Extreme ecosystems studies in the deep ocean: technological developments	2.000.000 €
FACEIT	Fast Advanced Cellular and Ecosystems Information Technologies	3.695.000 €
ECODIS	Dynamic Sensing of Chemical Pollution Disasters and Predictive Modelling of Their Spread and Ecological Impact	3.500.000 €
	Coordination Actions (CA)	
ENCORA	EUROPEAN NETWORK ON COASTAL RESEARCH	3.000.000 €
	Specific Support Actions (SSA)	
GRAND	GRAND GOOS Regional Alliances Network Development	520.000 €
SEPRISE	Sustained, Efficient Production of Required Information and Services within Europe is our only justification	330.000 €
ESONIM	European Seafloor Observatory Network Implementation Model	427.000 €
ASCABOS	A Supporting Programme for Capacity Building in the Black Sea Region towards Operational Status of Oceanographic Services	460.000 €
SIMORC	Proposal to establish a System of Industry Metocean data for the Offshore and Research Communities	500.000 €
SEARCH for DAMOCLES	Study for Environmental Arctic Change—Developing Arctic Modelling and Observing Capabilities for Long-term Environmental Studies	605.000 €

BASIN	Resolving the impact of climatic processes on ecosystems of the North Atlantic basin and shelf seas: integrating and advancing observation, monitoring, and prediction	115.000 €
TENATSO	Tropical Eastern North Atlantic Time-Series Observatory	550.000 €

ENERGY (Priority 1.1.6 – 1.1.6.1.3) – Total funding: 13.474.000 €

Integrated Projects (IP)		
BEATRICE WINDENERGY	Beatrice Offshore Deepwater Wind farm Project	2.000.000 €
LOWEC	Low offshore wind energy cost	4.000.000 €
	Specific targeted research or innovation projects (STREP)	
Wave SSG		1.000.000 €
SEEWEC		2.300.000 €

RACEWAYS	A HYPERINTENSIVE FISH FARMING CONCEPT FOR LASTING COMPETITIVENESS AND SUPERIOR PRODUCTION	890.700 €
COMPETUS	Genetic improvement of farmed sea bass, <i>Dicentrarchus labrax</i> : Strain testing and response to selection	523.764 €
SPONGES	Sustainable production, Physiology, Oceanography, Natural products, Genetics and Economics of Sponges	1.441.901 €
IntelFishTank	Development of an intelligent fish tank for cost effective aquaculture through control of water quality in each different fish tank.	623.463 €
HELICAS	Innovative utilization strategies for sunflower biomass	566.828 €
AQUAETREAT	Improvement and innovation of aquaculture effluent treatment Technology (AQUAETREAT)	1.383.741 €
CRAB	Collective Research on Aquaculture Biofouling (CRAB)	1.584.733 €
TURPRO	Biological optimisation and development of processing methods for turbot farming (TURPRO)	750.000 €
OCEANSAVER	Dramatically reducing spreading of invasive, non-native exotic species into new ecosystems through n efficient and high volume capacity Ballast Water Cleaning System	705.411 €

	(OCEANSAVER)	
SUBFISHCAGE	Development of a cost effective submersible fish cage system (SUBFISHCAGE)	705.414 €
FPSO-INSPECT	Non-Intrusive In-service Inspection Robotic System for Condition Monitoring of Welds inside Floating Production Storage and Offloading (FPSO) Vessels (FPSO-INSPECT)	1.093.120 €
DOLFIN	Development of Innovative Plastic Structures for Aquiculture using a New Composite with crop waste as reinforcing filler (DOLFIN)	612.482 €
PROTENCH	INTENSIVE AND SUSTAINABLE CULTURE OF THE FRESHWATER SPECIES TENCII	941.823 €
ALFA	DEVELOPMENT OF AN AUTOMATED INNOVATIVE SYSTEM FOR CONTINUOUS LIVE FEED PRODUCTION IN AQUACULTURE HATCHERY UNITS	1.143.776 €
MusselHarvest	Development of a cost effective technique for mussel harvesting combined with product control and retubing	527.184 €
HULL INSPECTOR	Development of an Autonomous Mobile Inspection Vehicle for Detecting Structural Defects in Ship's Hulls	1.035.606 €
KEYZONES(R)	To investigate sustainable biological carrying capacities of key European coastal zones	755.281 €

International Cooperation (INCO) – Total funding: 23.677.725 €

CLEAN BLACK SEA	Clean Black Sea Working Group	47.725 €
GEWAMED	Mainstreaming gender dimensions into water resources development and management in the Mediterranean region	1.250.000 €
MELIA	Mediterranean dialogue on integrated water management	2.000.000 €
MANGROVE	Mangrove ecosystems, communities and conflict: developing knowledge-based approaches to reconcile multiple demands	850.000 €

ECOST	Ecosystems, societies, consilience, precautionary principle: development of an assessment method of the societal cost for best fishing practices and efficient public policies	3.100.000 €
ECOMANAGE	Integrated ecological coastal zone management system	1.400.000 €
INCOFISH	Integrating multiple demands on coastal zones with emphasis on aquatic ecosystems and fisheries	4.400.000 €
PASARELAS	Discovery Modelling Mediation Deliberation: Interface tools for Multi-stakeholder knowledge partnerships for the sustainable management of marine resources and coastal zones.	280.000 €
REEFRES	Developing ubiquitous restoration practices for Indo-Pacific reefs	1.700.000 €
TBTIMPACTS	Assessing impacts of TBT on multiple coastal uses	800.000 €
SPEAR	Sustainable options for people, catchment and aquatic resources	1.500.000 €
TRANSMAP	Transboundary networks of marine protected areas for integrated conservation and sustainable development: biophysical, socio-economic and governance assessment in East Africa	1.700.000 €
PUMPSEA	Peri-urban mangroves forests as filters and potential phytoremediators of domestic sewage in East Africa	1.650.000 €
CENSOR	Climate variability and El Nino southern oscillation: implications for natural coastal resources and management	3.000.000 €

Marie Curie Actions (Human resources & Mobility)–Total funding:12.438.840 €

	Research Training Networks	
FISHACE	Fisheries-induced Adaptive Changes in Exploited Stocks	2.873.430 €
MOMARNET	Monitoring deep seafloor hydrothermal environments on the Mid-Atlantic Ridge	2.620.222 €
WAVETRAN	Research training network towards competitive ocean wave energy	1.820.000 €

	Intra-European Fellowship	
BIO-ENGINEERS	Influence of biological and physical processes on intertidal sediment dynamics and on the release of pollutants trapped in sediments and the toxicity of these pollutants	159.046 €
BIOECOTOX	Biomarkers: the early warning sentinel of chemical pollution risk assessment	151.287 €
BIOWARM	Marine sponges as models for assessing biological effects of the Mediterranean Sea warming	144.098 €
CAESAR	Capillary electrophoresis separation of dissolved carbohydrates of the aquatic realm	149.843 €
CD-PALEO	Development of Cadmium isotopic measurements by MC-ICP-MS using a double spike approach: Application to marine sediments and paleoceanography	148.021 €
CHARMAD	Chemical characterisation and cycling of marine dissolved organic matter	150.237 €
DINO-CULT	Calcareous dinoflagellate culturing experiments: understanding the life cycle of oceanic species	159.046 €
HYDRAMED	Geological Assessment of Gas Hydrates in the Mediterranean Sea	197.239 €
ISOCLIV	Exploring the influence of intraseasonal oscillations on the climate variability in the Indo-Pacific sector during boreal summer	152.242 €
LIST	Larvae in situ tracking: detection and identification of early-life-stages of marine organisms using in situ hybridisation with oligonucleotide probes	148.588 €
MACRO-MSAA	Synthesis of Marine Macrolides and Hybrid Structures as Novel Microtubule Stabilising Anticancer Agents	162.448 €
MARCYAN2	Ecological control of nitrogen fixation in marine Cyanobacteria	149.276 €
MIDIA	Molecular indicators of DNA damage in aquatic organisms	170.500 €

MOSEVEM	Modelling sedimentation and vegetation patterns in tidal marshes	149.821 €
MT GENOME G.SALARIS	The mitochondrial genome of the fish parasite Gyrodactylus salaris - characterization and utility	158.479 €
PLAICELIFELINE	Determination of Plaice lifetime movements in the North Sea by linking natural and electronic data records	159.046 €
S.ATLANTIC PLUME	The characterisation and temporal evolution of the South Atlantic Plume	168.232 €
VENTSULFURMICDIV	Biodiversity of microbial communities involved in sulphur cycling at a shallow water hydrothermal vent	148.262 €
	Outgoing International Fellowship	
LOTUS	Long time-series undersea surveillance	254.389 €
	Incoming International Fellowship	
AUVI	Autonomous vehicle for underwater inspections	65.950 €
ECCRE	Biodiversity and Vulnerability of European Cold-Water Coral Reef Ecosystem	169.366 €
	European Re-integration Grants	
CLOWNFISH EVOLUTION	Molecular phylogeny and evolution of specialization in anemone fishes and in their host sea anemones	37.165 €
FISH CONDITION	Effects of environmental and habitat characteristics on condition and reproduction of exploited marine fish populations	25.052 €
PHYTODEATH	Effect of ultraviolet radiation on programmed cell death in phytoplankton: impact on biomass cycling and biodiversity	40.000 €
	Early stage Training	
RISICO	Risk assessment of surfactants in coastal environments	710.049 €
	Transfer of knowledge	
PARAQUAM	Parasite pathogens in new species of Mediterranean aquaculture: an experimental	287.360 €

	approach	
SEAPAID	Sea grass production and isotopic discrimination	132.505 €

	Specific Support Actions (SSA)	
DOCREG	DEVELOPMENT OF OCEANOGRAPHIC RESEARCH IN GREECE	42.000 €

	Series of events	
AQUALABS	Advanced laboratory training courses in Aquaculture for early-stage researchers	535.641 €

Infrastructures – Total funding: 25.573.588 €

	Integrating Activities and Transnational Access	
SEADATANET	SEADATANET - A Pan-European Infrastructure for Ocean and Marine Data Management	8.749.990 €
Black Sea SCENE	Black Sea Scientific Network	2.000.000 €
HYDRALAB-III	Integrated Infrastructure Initiative HYDRALAB-III	11.812.100 € Under negotiation
SALVADORE	Seismic analysis of the lithosphere via advanced processing techniques and access to deep ocean recorders during exploration	682.666 €
METRI - 2	Marine Environment Tests and Research Infrastructure - 2	700.000 €
	Design Studies and Construction of New RI	
DesignACT	Designing the European Aquaculture Centre of Technology	475.400 €
CeMaCE	Centre for Marine Chemical Ecology	937.432 €
	Accompanying Measures	

PLANKTON-NET	An open-access framework for developing and supporting distributed knowledge centres for taxonomic data – a pilot study targeting EU phytoplankton	216.000 €
